Other	\$ (1,972.5)	\$ (1,960.8)
Total Liabilities	\$ (47,778.8)	\$ (45,333.1)
Net Position¹	\$ (41,723.4)	\$ (39,649.3)
Sustainability Measures (Dollars in Trillions):		
Social Insurance Net Expenditures	\$ (88.4)	\$ (78.3)
Total Federal Non-Interest Net Expenditures	\$ (79.6)	\$ (72.7)
Sustainability Measures as Percent GDP:		
Social Insurance Net Expenditures ²	(4.6%)	(4.2%)
Total Federal Non-Interest Net Expenditures	(3.9%)	(3.6%)
Fiscal Gap ³	(4.7%)	(4.3%)
<p>¹ The government's net position is calculated in accordance with federal accounting standards. Per these standards, net position does not include the financial value of the government's sovereign power to tax, regulate commerce, or set monetary policy, or the value of nonoperational resources, such as national and natural resources, for which the government is a steward.</p> <p>² Pursuant to federal accounting standards, for SOSI reporting, the federal government's social insurance programs include Social Security; Medicare Parts A, B, and D; DOL's Black Lung program; and the RRB.</p> <p>³ To prevent the debt-to-GDP ratio from rising over the next 75 years, a combination of non-interest spending reductions and receipts increases that amount to 4.7 percent of GDP on average is needed (4.3 percent of GDP on average in FY 2024). See Financial Statement Note 24 for additional information.</p> <p>* Restated for prior period adjustment due to correction of error (see Financial Statement Note 1.V).</p>		

Executive Summary to the FY 2025 Financial Report of the United States Government

The Fiscal Year (FY) 2025 *Financial Report of the U.S. Government* ([Financial Report](#)) presents the U.S. (United States) government’s current financial position and condition, and discusses key financial topics and trends. The *Financial Report* is produced by the Department of the Treasury (Treasury) in coordination with Office of Management and Budget (OMB), which is part of the Executive Office of the President. The table on the preceding page presents several key indicators of the government’s financial position and condition, which are discussed in this Executive Summary and, in greater detail, in the *Financial Report*. The Secretary of the [Treasury](#), the Director of [OMB](#), and the Comptroller General of the U.S. at the U.S. Government Accountability Office ([GAO](#)) believe that the information discussed in the *Financial Report* is important to all Americans.

The *Financial Report* addresses the government’s financial activity and results as of and for the fiscal years ended September 30, 2025, and 2024. Note 29—Subsequent Events discusses events that occurred after the end of the fiscal year that may affect the government’s financial position and condition.

Results in Brief

The “Nation by the Numbers” table on the preceding page and the following summarize key metrics about the federal government’s financial position for and during FY 2025:

- The budget deficit decreased by \$41.4 billion (2.3 percent) to \$1.8 trillion and net operating cost decreased by \$292.0 billion (12.2 percent) to \$2.1 trillion. The primary contributor to the difference between the deficit and net operating cost is an increase in the liability for federal employee and veteran benefits payable that affects the government’s current-year costs but does not affect the current-year budget deficit.
- The government’s gross costs of \$8.1 trillion, less \$752.2 billion in revenues earned for goods and services provided to the public, plus \$18.6 billion in net losses from changes in assumptions yields the government’s net cost of \$7.3 trillion, a decrease of \$25.3 billion (0.3 percent) from FY 2024.
- Net cost decreased but is subject to both cost increases and decreases across the government. For example:
 - The largest decreases were due to: 1) changes in student loan program subsidy estimates at the Department of Education (Education); and 2) significant net decreases in losses stemming from changes in assumptions affecting cost and liability estimates for the government’s employee and veteran benefits.
 - The largest increases were due to increases in federal benefit expenses at the Department of Health and Human Services (HHS) for the Medicare and Medicaid programs and at the Social Security Administration (SSA).
- Tax and other unearned revenues increased by \$266.7 billion to \$5.2 trillion, including the effects of: 1) an increase in individual income tax collections; and 2) an increase in customs duties of \$133.9 billion (275.3 percent) due in large part to multiple tariffs implemented during FY 2025. Deducting these revenues from net cost yields the federal government’s “bottom line” net operating cost of \$2.1 trillion referenced above.
- Comparing total government assets of \$6.1 trillion (including \$2.0 trillion of loans receivable, net and \$1.4 trillion of Property, Plant, and Equipment (PP&E)) to total liabilities of \$47.8 trillion (including \$30.3 trillion in federal debt and interest payable, and \$15.5 trillion of federal employee and veteran benefits payable) yields a negative net position of \$41.7 trillion.
- The Statements of Long-Term Fiscal Projections (SLTFP) show that the present value (PV) of total non-interest spending, over the next 75 years, under current policy, is projected to exceed the PV of total receipts by \$79.6 trillion (total federal non-interest net expenditures from the “Nation By The Numbers”

table), an increase of \$6.9 trillion from FY 2024 results.

- The debt held by the public as a percent of gross domestic product (GDP), or debt-to-GDP ratio, was 99 percent at the end of FY 2025. Under current policy and based on this report’s assumptions, it is projected to reach 576 percent by 2100. The projected continuous rise of the debt-to-GDP ratio indicates that current policy is unsustainable.
- The Statements of Social Insurance (SOSI) show that the PV of the government’s expenditures for Social Security and Medicare Parts A, B and D, as well as other social insurance programs over 75 years is projected to exceed social insurance revenues by about \$88.4 trillion, an increase of \$10.1 trillion compared to 2024 social insurance projections.

Where We Are Now

The government’s financial position and condition have traditionally been expressed through the *Budget of the U.S. Government (Budget)*, focusing on surpluses, deficits, and debt. However, this primarily cash-based discussion of the government’s net outlays (deficit) or net receipts (surplus) tells only part of the story. The government’s accrual-based net position, (the difference between its assets and liabilities), and its “bottom line” net operating cost (the difference between its revenues and costs) are also key financial indicators. Refer to the financial statements, disclosures, and other information in this *Financial Report*, as well as in the individual entities’ Agency Financial Reports (AFRs) for more information.

The government’s net costs, assets, liabilities, and budget deficit were restated to correct errors as part of Department of Defense¹ (DOD) and Security Assistance Accounts (SAA) efforts to improve financial reporting. See the Management’s Discussion and Analysis (MD&A) section and Note 1.V—Corrections of Errors for more information.

Comparing the Budget and the Financial Report

The *Budget* and the *Financial Report* present complementary perspectives on the government’s financial position and condition.

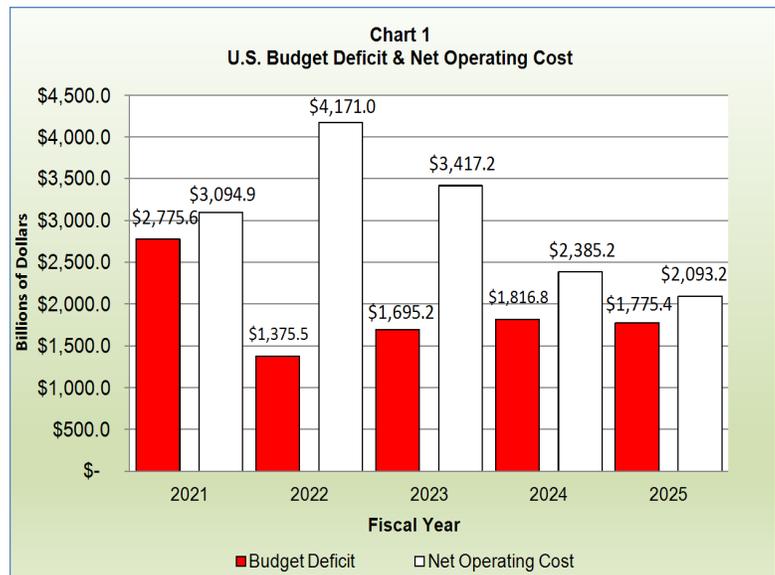

- The *Budget* is the government’s primary financial planning and control tool. It accounts for past government receipts and spending and includes the President’s proposed receipts and spending plan. Receipts are cash received by the U.S. government and spending is measured as outlays, or payments made by the federal government to the public or entities outside the government. When total receipts exceed outlays, there is a budget surplus; conversely, if total outlays exceed total receipts, there is a budget deficit.
- The *Financial Report* includes the government’s costs and revenues, assets and liabilities, and other important financial information. It compares the government’s revenues (amounts earned, but not necessarily collected), with costs (amounts incurred, but not necessarily paid) to derive net operating cost.

¹ As referenced in the FY 2025 DOD AFR, this report refers to the Department of Defense (DOD) in accordance with statutory requirements. While mindful of Executive Order 14347 and ongoing legal determinations regarding the Department’s name, this report utilizes the designation “Department of Defense” because the DOD AFR and this *Financial Report* are statutorily mandated reports, all relevant legislation designates the Department as the “Department of Defense,” and the funding for programs discussed in the DOD AFR was issued to DOD.

Chart 1 compares the government's budget deficit (receipts vs. outlays) and net operating cost (revenues vs. costs) for FYs 2021 - 2025. During FY 2025:

- A \$316.5 billion increase in receipts, more than offset a \$275.1 billion increase in outlays resulting in a \$41.4 billion (2.3 percent) decrease in the budget deficit from \$1,816.8 billion to \$1,775.4 billion.
- Net operating cost decreased \$292.0 billion or 12.2 percent from \$2.4 trillion to \$2.1 trillion, due mostly to a \$25.3 billion or 0.3 percent decrease in net cost combined with a \$266.7 billion or 5.4 percent increase in tax and other unearned revenues.

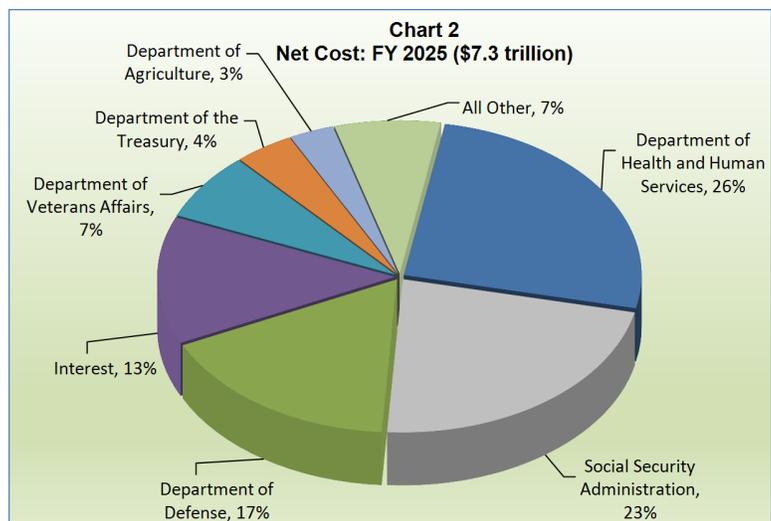

The \$317.8 billion difference between the budget deficit and net operating cost for FY 2025 is primarily due to accrued costs (incurred but not necessarily paid) that are included in net operating cost, but not the budget deficit. These are primarily actuarial costs related to federal employee and veteran benefits programs, particularly at Department of Veterans Affairs (VA), DOD, and Office of Personnel Management (OPM). Other sources of differences include but are not limited to: 1) increases in PP&E, including acquisitions, depreciation, and revaluation and disposals; 2) decreases in advances and prepayments made by the federal government; 3) the accrual of non-cash earned revenue related to investments in Government-Sponsored Enterprises (GSEs); and 4) a timing difference when credit program costs are recorded in the budget versus net operating cost.

Costs and Revenues

The government's "bottom line" net operating cost decreased \$292.0 billion (12.2 percent) during FY 2025 to \$2.1 trillion. It is calculated as follows:

- Starting with total gross costs of \$8.1 trillion, the government subtracts earned program revenues (e.g., Medicare premiums, national park entry fees, and postal service fees) and adjusts for gains or losses from changes in actuarial assumptions used to estimate future federal employee and veteran benefits payments to derive its net cost before taxes and other unearned revenues of \$7.3 trillion (see Chart 2), a decrease of \$25.3 billion (0.3 percent) from FY 2024. This net decrease is the combined effect of many offsetting increases and decreases across the government. For example:

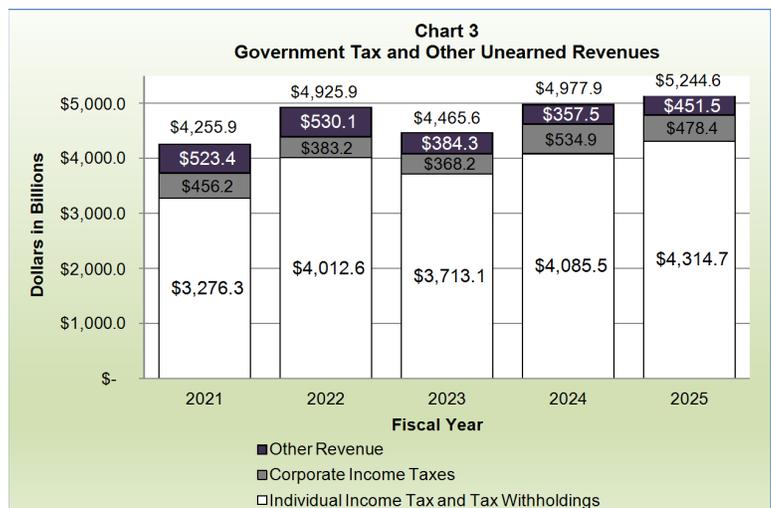

- [Education](#) net costs decreased \$269.3 billion due largely to significant changes in loan program subsidy cost estimates.
- Entities administering federal employee and veteran benefits programs, including the [VA](#), [DOD](#), and [OPM](#) employ a complex series of assumptions to make actuarial projections of their long-term benefits

liabilities. These assumptions include but are not limited to interest rates, beneficiary eligibility, life expectancy, and medical cost levels. Changes in these assumptions can result in either losses (net cost increases) or gains (net cost decreases). Across the government, these net losses from changes in assumptions amounted to \$18.6 billion in FY 2025, a loss decrease (and a corresponding net cost decrease) of \$265.0 billion compared to FY 2024. For example:

- A \$275.1 billion net cost decrease at [OPM](#) was attributed primarily to a \$180.4 billion gain from assumptions changes in FY 2025 as compared to an \$83.8 billion loss in FY 2024 for both OPM’s retirement and health programs. Gains were attributed to updated mortality assumptions, among other factors.
 - A \$50.2 billion net cost increase at [VA](#) included a \$6.5 billion increase in VA’s gain from changes in assumptions from \$37.7 billion in FY 2024 to \$44.2 billion in FY 2025. VA net costs increased overall due in large part to an increase of more than four million veterans’ compensation payments as well as expansion of medical services pursuant to implementation of the *Sergeant First Class Heath Robinson Honoring Our Promise to Address Comprehensive Toxins (PACT) Act*.
 - A [DOD](#) net cost increase of \$18.9 billion includes the effect of a \$5.2 billion loss increase from changes in assumptions. However, most of DOD’s net costs included those related to military operations, readiness and support, procurement, personnel, and Research and Development (R&D).
- A \$148.1 billion net cost increase at [HHS](#) mostly due to increases in: 1) Medicare benefit expenses (including Supplementary Medical Insurance (SMI) and Hospital Insurance (HI)) due to increases in the number of beneficiaries, the rate of benefits paid, and in prescription drug spending; and 2) Medicaid benefit expenses where enrollees slightly decreased, but costs increased.
 - Social Security Administration ([SSA](#)) net costs increased \$125.2 billion due largely to a 2.1 million person increase in the number of Old-Age and Survivors Insurance (OASI) beneficiaries, combined with a 2.5 percent Cost of Living Adjustment (COLA) provided to beneficiaries in 2025.
 - A \$74.5 billion increase in [Treasury](#) net costs was largely due to an increase in the liquidation of advances associated with Treasury’s pandemic relief programs. Treasury issued advance payments to cover anticipated qualified incurred costs; these advances are subsequently recognized as expenses as the recipients incur the qualified costs.
 - [Interest costs related to federal debt securities held by the public](#) increased \$78.0 billion due largely to an increase in the outstanding debt held by the public.
- The government deducts tax and other revenues from net cost (with some adjustments) to derive its FY 2025 “bottom line” net operating cost of \$2.1 trillion.

- From Chart 3, total government tax and other unearned revenues increased by \$266.7 billion (5.4 percent) to about \$5.2 trillion for FY 2025 due primarily to an increase in individual income tax collections partially offset by a decrease in corporate tax collections.

- Together, individual income tax and tax withholdings, and corporate income taxes accounted for about 91.4 percent of total tax and other unearned revenues in FY

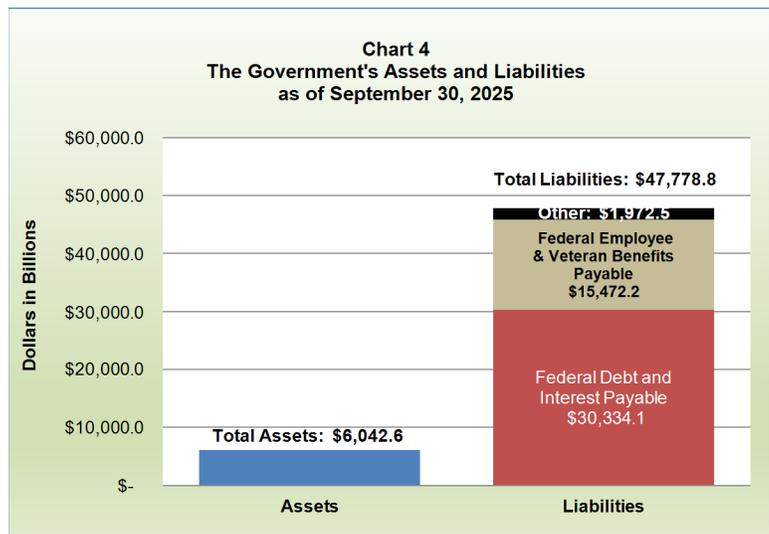

2025. Other unearned revenues include Federal Reserve earnings, excise taxes, and customs duties. Notably, the increase in revenues includes the effect of a \$133.9 billion (275.3 percent) increase in custom duties to \$210.3 billion pursuant to multiple tariffs implemented during FY 2025.

Assets and Liabilities

Chart 4 summarizes the assets and liabilities that the government reports on its Balance Sheet. As of September 30, 2025:

- 84.1 percent of the federal government's total assets (\$6.1 trillion) consist of: 1) \$1.2 trillion in cash and monetary assets; 2) \$504.2 billion in inventory and related property; 3) \$2.0 trillion in loans receivable, net (primarily student loans); and 4) \$1.4 trillion in net PP&E.

- Cash and monetary assets (\$1.2 trillion) is comprised largely of the operating cash of the U.S. government. Operating cash held by Treasury increased \$1.1 billion (0.1 percent) to \$871.9 billion during FY 2025.
- Inventory and related property (\$504.2 billion) includes: 1) inventory, which is tangible personal property that is either held for sale, in the process of production for sale, or to be consumed in the production of goods for sale or in the provision of services for a fee; 2) operating materials and supplies (OM&S), or tangible personal property to be consumed in normal operations (e.g., spare and repair parts, ammunition, and tactical missiles); and 3) stockpiles, or strategic and critical materials held due to statutory requirements for use in national defense, conservation, or local/national emergencies.
- Loans receivable, net (\$2.0 trillion) is comprised of loans provided by multiple agencies, including [Education](#) and Small Business Administration ([SBA](#)), to promote the nation's welfare by making financing available to segments of the population not served adequately by non-federal institutions or otherwise providing for certain activities or investments. Loans Receivable also includes Treasury's \$96.4 billion in notes issued by trusts created by Federal Deposit Insurance Corporation (FDIC) in its receivership capacity and backed by a guarantee from the FDIC in its corporate capacity.
- Federal government PP&E includes many of the physical resources that are vital to the federal government's ongoing operations, including buildings, structures, facilities, equipment, internal use software, and general-purpose land. [DOD](#) comprises approximately 70.2 percent of the government's reported PP&E of \$1.4 trillion as of September 30, 2025.
- Other significant government resources not reported on the Balance Sheet include the government's power to tax and set monetary policy, natural resources, and stewardship assets. Stewardship assets, including heritage assets and stewardship land, benefit the nation (e.g., national monuments, national parks) and are intended to be held indefinitely.
- Total liabilities (\$47.8 trillion) consist mostly of: 1) \$30.3 trillion in federal debt and interest payable; and 2) \$15.5 trillion in federal employee and veteran benefits payable.
- Federal debt held by the public is debt held outside of the government by individuals, corporations, state and local governments, the Federal Reserve System (FR System), foreign governments, and other non-federal entities.

- The government borrows from the public (increases federal debt levels) to finance deficits. During FY 2025, federal debt held by the public increased \$2.0 trillion (7.0 percent) to \$30.3 trillion.
- The government also reports about \$7.3 trillion of intra-governmental debt outstanding, which arises when one part of the government borrows from another. For example, government funds (e.g., [Social Security and Medicare Trust Funds](#)) typically must invest excess receipts, including interest earnings, in Treasury-issued federal debt securities. Although not reflected in Chart 4, these securities are included in the calculation of federal debt subject to the debt limit.
- Federal debt held by the public plus intra-governmental debt equals gross federal debt, which with some adjustments, is subject to a statutory debt ceiling ("debt limit"). On June 3, 2023, Public Law (P.L.) 118-5 was enacted suspending the debt limit through January 1, 2025. On January 21, 2025, a delay in raising the debt limit commenced at which time Treasury undertook extraordinary measures to avoid exceeding the statutory debt limit. On July 4, 2025, Congress and the President enacted P.L. 119-21, commonly referred to as the *One Big Beautiful Bill Act* (OBBBA). Prominent components of P.L. 119-21 are *Working Family Tax Cuts* (WFTC), which provide federal income tax deductions for certain income from Social Security benefits, overtime, and tips (P.L. 119-21). P.L. 119-21 raised the debt limit from \$36,104.0 billion to \$41,104.0 billion. On July 7, 2025, Treasury discontinued the use of extraordinary measures and resumed normal debt management operations. At the end of FY 2025, debt subject to the statutory limit was \$37.5 trillion. Increasing or suspending the debt limit does not increase spending or authorize new spending; rather, it permits the government to continue to honor pre-existing commitments (see Note 12—Federal Debt and Interest Payable).
- Federal employee and veteran benefits payable (\$15.5 trillion) represents the amounts of benefits payable by agencies that administer the government’s pension and other benefit plans for its military and civilian employees.

The federal workforce experienced significant change during 2025, including from Reductions in Force (RIF) and implementation of the “Deferred Resignation Program” (DRP). The DRP allowed eligible employees to resign voluntarily while receiving paid administrative leave (salary and benefits) from employees’ DRP effective date through fiscal or calendar-year end 2025. According to OPM’s website, during calendar-year 2025, “the government hired roughly 68,000 people this year, while approximately 317,000 employees left the government.”²

See Note 29—Subsequent Events for information about events that occurred after the end of the fiscal year that may affect the government’s financial position and condition.

Key Economic Trends

An analysis of U.S. economic performance provides useful background when evaluating the government’s financial statements. U.S. economic performance and other economic and financial developments are discussed in the Management’s Discussion and Analysis section of the *Financial Report*.

An Unsustainable Fiscal Path

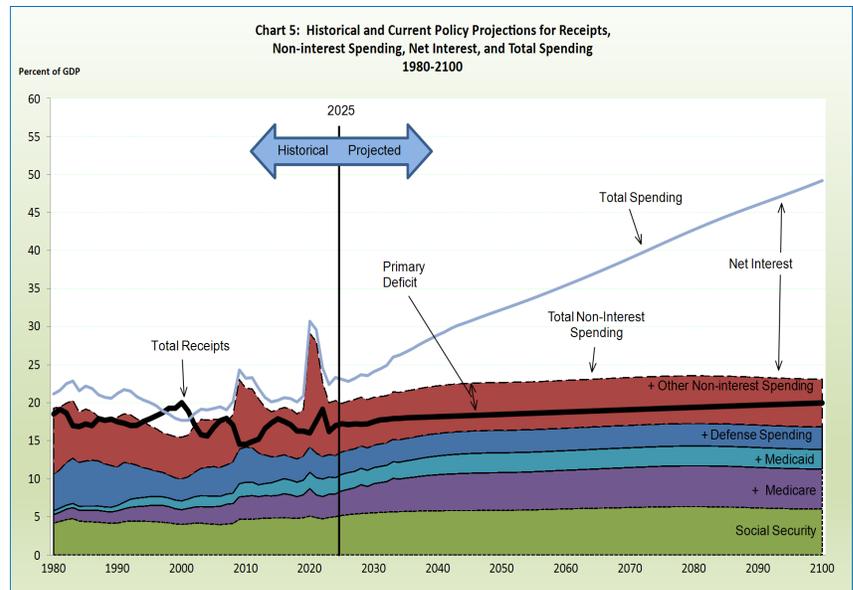

An important purpose of this *Financial Report* is to help citizens understand current fiscal policy and the importance and magnitude of policy reforms necessary to make it sustainable. A sustainable fiscal policy is defined in this report as one where the debt-to-GDP ratio is stable or declining over the long term. GDP measures the size of the nation’s economy in terms of the total value of all final goods and services that are produced in a year. Considering financial results relative to GDP is a useful indicator of the economy’s capacity to sustain the government’s many programs. This *Financial Report* presents data, including debt, as a percent of GDP to help readers assess whether current fiscal policy is sustainable. The debt-to-GDP ratio was 99 percent at the end of FY 2025, up slightly from approximately 98 percent at the end of FY 2024. The long-term fiscal projections in this *Financial Report* are based on the same economic and demographic assumptions that underlie the SOSI.

The current fiscal path is unsustainable. To determine if current fiscal policy is sustainable, the projections based on the assumptions discussed in the *Financial Report* assume current policy will continue indefinitely.³ The projections are therefore neither forecasts nor predictions. Nevertheless, the projections demonstrate that policy changes need to be enacted to achieve a sustainable fiscal policy.

Receipts, Spending, and the Debt

Chart 5 shows historical and current policy projections for receipts, non-interest spending by major category, net interest, and total spending expressed as a percent of GDP.

- The primary deficit is the difference between non-interest spending and receipts. The ratio of the primary deficit to GDP is useful for gauging long-term fiscal sustainability.
- The primary deficit-to-GDP ratio spiked during 2009 through 2012 due to the 2008-09 financial crisis and the ensuing severe recession, and rose again in 2020 due to the Coronavirus Disease 2019 (COVID-19) pandemic and ensuing economic downturn. Increased spending and temporary tax reductions enacted to stimulate the economy and support recovery contributed to elevated primary deficits over both periods, resulting in sharp increases in the ratio of debt to GDP. The primary deficit-to-GDP ratio in 2025 was 2.7 percent, a decrease of 0.6 percentage points from the primary deficit-to-GDP ratio in last year’s *Financial Report* partially due to higher receipts.

- The primary deficit-to-GDP ratio is projected to average 3.3 percent over the next 10 years, based on the technical assumptions in this *Financial Report*, and projected changes in receipts and outlays, then

³ Current policy in the projections is based on current law but includes extension of certain policies that expire under current law but are routinely extended or otherwise expected to continue. The assumptions that underlie this analysis are discussed in the Management’s Discussion and Analysis and Note 24—Long-Term Fiscal Projections sections of this *Financial Report*. See the “Departures of Current Policy from Current Law” in Note 24.

increase to a peak of 4.2 percent in 2046, and then gradually decrease to 3.1 percent of GDP in 2100, the last year of the projection period.

- The persistent long-term gap between projected receipts and total spending shown in Chart 5 occurs despite the projected effects of the *Patient Protection and Affordable Care Act (PPACA)*⁴ on long-term deficits.
 - Enactment of the PPACA in 2010 and the *Medicare Access and Children’s Health Insurance Program Reauthorization Act of 2015 (MACRA) (P.L. 114-10)* in 2015 established cost controls for Medicare hospital and physician payments whose long-term effectiveness is still to be demonstrated fully.
 - There is uncertainty about the extent to which these projections can be achieved and whether the PPACA’s provisions intended to reduce Medicare cost growth will be overridden by new legislation.

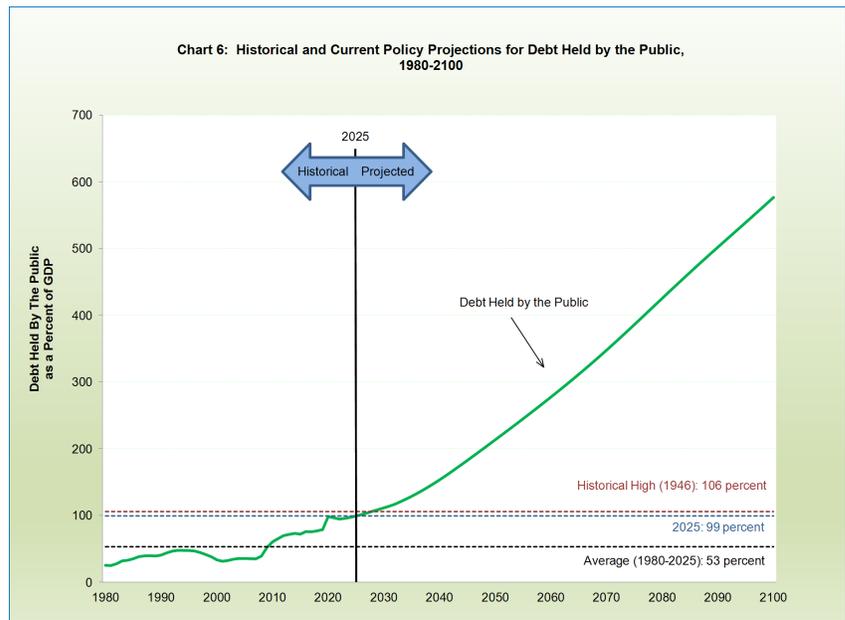

Table 1 summarizes the status and projected trends of the government’s Social Security and Medicare Trust Funds.

Table 1: Trust Fund Status		
Fund	Projected Depletion	Projected Post-Depletion Trend
Medicare Hospital Insurance *	2033	In 2033, trust fund income is projected to cover 89 percent of scheduled benefits, decreasing to 86 percent in 2049, then returning to 100 percent by 2099.
Combined Old-Age Survivors and Disability Insurance **	2034	In 2034, trust fund income is projected to cover 81 percent of scheduled benefits, decreasing to 72 percent by 2099.

* Source: 2025 Medicare Trustees Report ** Source: 2025 OASDI Trustees Report
 This Report's projections assume full Social Security and Medicare benefits are paid after fund depletion contrary to current law.

The primary deficit projections in Chart 5, along with those for interest rates and GDP, determine the debt-to-GDP ratio projections in Chart 6.

- The debt-to-GDP ratio was 99 percent at the end of FY 2025, and under current policy and based on this report’s assumptions is projected to reach 576 percent in 2100.
- The debt-to-GDP ratio rises continuously in great part because primary deficits lead to higher levels of debt. The continuous rise of the debt-to-GDP ratio indicates that current fiscal policy under this *Financial Report’s* assumptions is unsustainable.
- These debt-to-GDP projections are higher than the corresponding projections in both the FY 2024 and 2023 *Financial Reports*.

⁴ The PPACA refers to [P.L. 111-148](#), as amended by [P.L. 111-152](#). The PPACA expands health insurance coverage, provides health insurance subsidies for low-income individuals and families, includes many measures designed to reduce health care cost growth, and significantly reduces Medicare payment rate updates relative to the rates that would have occurred in the absence of the PPACA. (See Note 25 and the Required Supplementary Information (RSI) section of the *Financial Report*, and the 2025 Medicare Trustees Report for additional information).

The long-term projections are highly uncertain. To illustrate this, the unaudited RSI section of the *Financial Report* presents alternative scenarios for the growth rate of health care costs, interest rates, discretionary spending, individual income tax receipts, and customs duties.

The Fiscal Gap and the Cost of Delaying Fiscal Policy Reform

- The 75-year fiscal gap is a measure of how much primary deficits must be reduced over the next 75 years in order to make fiscal policy sustainable. That estimated fiscal gap for 2025 is 4.7 percent of GDP (0.3 percentage points higher than 2024).
- This estimate implies that making fiscal policy sustainable over the next 75 years would require some combination of spending reductions and receipt increases that equals 4.7 percent of GDP on average over the next 75 years. The fiscal gap represents 25.1 percent of 75-year PV receipts and 20.7 percent of 75-year PV non-interest spending.
- The timing of policy changes to make fiscal policy sustainable has important implications for the well-being of future generations as is shown in Table 2.

Period of Delay	Change in Average Primary Surplus
Reform in 2026 (No Delay)	4.7 percent of GDP between 2026 and 2100
Reform in 2036 (Ten-Year Delay)	5.6 percent of GDP between 2036 and 2100
Reform in 2046 (Twenty-Year Delay)	6.9 percent of GDP between 2046 and 2100

- Table 2 shows that, if reform begins in 2036 or 2046, the estimated magnitude of primary surplus increases necessary to close the 75-year fiscal gap is 5.6 percent and 6.9 percent of GDP, respectively. The difference between the primary surplus increase necessary if reform begins in 2036 or 2046 and the increase necessary if reform begins in 2026, an additional 0.9 and 2.2 percentage points, respectively, is a measure of the additional burden policy delay would impose on future generations.
- The longer policy action to close the fiscal gap is delayed, the larger the post-reform primary surpluses must be to achieve the target debt-to-GDP ratio at the end of the 75-year period. Future generations are harmed by a policy delay because the higher the primary surpluses are during their lifetimes, the greater the difference is between the taxes they pay and the programmatic spending from which they benefit.

Conclusion

- Projections in the *Financial Report* indicate that the government's debt-to-GDP ratio is projected to rise over the 75-year projection period and beyond if current policy is kept in place. The projections in this *Financial Report* show that current policy is not sustainable.
- If changes in fiscal policy are not so abrupt as to slow economic growth and those policy changes are adopted earlier, then the required changes to revenue and/or spending will be smaller to return the government to a sustainable fiscal path.
